What is considered other in android storage. How to delete others in storage android xiaomi.

In days when 64GB storage has become almost standard across Android phones, storage is usually not a big issue. However, it may become a problem if you are not using your Android phone right. There are basic steps/tips that you need to follow to keep storage space free on your Android phone. Here are 'mistakes' that you need to stop making on your Android phone right now to make sure there are no storage woes for you.1828384858687888 (Image credit: Tom's Guide) Many of the best Android phones use USB-C ports for charging and transferring files back and forth with your PC, but what if the files you need to email your boss are sitting on a Flash drive or a full-size SD card? Fortunately, with an inexpensive adapter cable, you can attach a USB key or card reader directly to your handset. You can even get a USB-C flash drive for an even easier process. Either way, you will need one of these things to get started if you can't upload the files from the storage medium to a cloud storage provider. So here's how to connect your Android phone to a USB storage device. What you need (Image credit: Tom's Guide) A USB Type-C male to USB Type-C male to USB Type-A female adapter ORToday's best Apple USB-C To USB Adapter deals (opens in new tab) (opens i new tab) (opens in new tab) View Deal (opens in new tab) (opens in new Connect with a USB OTG cable 1. Connect a flash drive (or SD reader with card) to the full-size USB female end of the adapter. (Image credit: Tom's Guide) 3. Swipe down from the top to show the notification shade. No need to do this if your file manager automatically appears. (Image credit: Tom's Guide)4. Tap USB Drive. (Image credit: Tom's Guide)You can now browse the files on the flash drive, follow steps 5 to 9.5. Tap Internal Storage to view the files on your phone. (Image credit: Tom's Guide) 6. Find the file you'd like to share. Hold down on it to select it.(Image credit: Tom's Guide) 7. Tap the three dots button.(Image credit: Tom's Guide) 8. Select Copy.(Image credit: Tom's Guide) 9. Android apps are a great way to expand the sometimes limited capabilities of Chromebooks, but they can be a problem if you store most of your data on an external medium—like an SD card, for example. RELATED: The Best Android Apps You Should be Using On Your Chromebook Fortunately, with a few commands you can actually "force" Android apps to not only see external storage, but write to it as well. I will warn you, though: this does require a few shell commands, so if you're not comfortable with that, tread carefully. Shout out to Nolirium for this incredibly helpful blog post that that got me rolling with this. Thanks to the guidance found there, I was able to get this this working without issue. So, How Does This Work? In short, we'll be using bind mounts to basically "tether" a folder on the external medium to one that's part of the internal file structure. Basically, this allows Android see the contents of the external folder, because it's linked to a folder on the internal storage, which it can see without problems. It's worth noting that binding these folders will only work in Android—it won't affect how Chrome OS sees the folders or the files within. We're going to create a folder on the external folder in the Bound directory, Chrome OS will not—the Bound directly will look completely empty. But since Chrome OS can natively interact with external storage, this shouldn't be an issue. Step One: Create Your Folders With that, we're ready to create a folder in the Downloads directory called "Bound." So go ahead and open the Chrome OS Files app, and navigate to the Downloads directory. From there, right click and choose "New Folder." Name this folder "Bound." It's worth noting that can name this whatever you like, but for the purposes of this tutorial and the commands you'll use below, we're using "Bound." If you have a specific set of files you want Android to be able to see on your Chromebook, go ahead and navigate to your external medium and create a new folder here, too. Name it accordingly—I'm using "Screenshots" for this example, so feel free to change it if it doesn't make sense for your application. Just remember that you'll have to change part of the commands below to reflect your folder name. Step Two: Open a Root Shell and Create the Bind First, you're going to need to open a Crosh window by pressing Ctrl+Alt+T on your keyboard. A new, solid black window will open in your browser. Alternatively, you can install the Crosh Window app from the Chrome App Store (which also requires the Secure Shell app to be installed), but that's not necessary if it's something you don't think you'll use often. In the Crosh window, type the following: shell Followed by: sudo su It will ask for your password—this should be the same one you sign into your Chromebook with. At this point, you're in a root shell, which is what we want. The following commands should give you read/write access to the external folder directly from Android apps. For the purposes of this tutorial, I'm going to break them down one at at time, but keep in mind that you can string them together if you'd like—just separate each command with && symbols. Note: The default title for an external drive in Chrome OS is "UNTITLED." If your drive has been named something else, use that in place of "UNTITLED" in the following commands. With that out of the way, enter the following into the root shell window: mount --bind /media/removable/UNTITLED/Screenshots /run/arc/sdcard/read/emulated/0/Download/Bound mount --bind /media/removable/UNTITLED/Screenshots /run/arc/sdc /media/removable/UNTITLED/Screenshots /run/arc/sdcard/write/emulated/0/Download/Bound Again, change the name of the external folder to whatever you chose if it's different than mine. Step Three: Profit That's pretty much all there is to it. Like I said earlier, this won't affect the way Chrome OS sees your folders, only Android. Of course, it's not a perfect system. Some Android apps may be able to see the contents of the bound folder, but not interact with them. For example, I use Skitch for annotating screenshots, and while it can see everything in the bound folder, it's unable to open any of the files. This is probably in large part to do with the fact that Skitch is no longer in active development so it's quite outdated, but it's still a good example of how imperfect this system can be. Also, this bind will not survive a reboot. So each time you reboot the computer, you'll have to re-enter the above commands. I've also seen where some users have lost access to the bound folder after the system goes into sleep mode, but I haven't personally had this issue. As with most workarounds like this one, your mileage may vary. PicSayPro showing the contents of the Bound folder. Of course, Google is actively working on enabling SD card contents to Android apps, so eventually we should get proper support. But until that point, this is the next best thing. Android: The Pocket app for Android was updated today with some handy new features, including the new ability to set your offline storage limits, a new quick delete mode, and improved Evernote integration. You can now set up offline storage limits so Pocket doesn't accidentally take up too much space on your device. Just head into the Settings, select "Set offline storage limits" and you can set up how much space Pocket's allowed to have. As far as the quick deletion is concerned, you can now quickly delete anything with a swipe, but there's a new undo button in case you didn't mean to delete it. Evernote formatting is also cleaned up so you the article sent to Evernote better resembles Pocket's Article View with formatting preserved. You can grab the update from Google Play right now.
