Photo Courtesy: @StarCraft/Twitter Building a game PC might be fun, or it could be quite frustrating, depending on how it approaches the search, and of course its own personal circumstances. You can be bound by a tight budget, and then experience difficulty choosing the right parts to achieve what you want in terms of performance. Or you could be a relative technology novice, and not sure how best to put together a PC that can cope well with modern games. Don't worry, because the help is at hand. Beginners should head to our article on how to build your first game PC, and then this guide gives you all the information you will need to put it together later, all broken so easy to follow steps. Is all the basic stuff covered, then - but what about the seals? In this function, we're going to look at five additional tips that you can't be aware of that will help make sure that your game PC is all you should be. Best games for 2020 PC: all must-play titles (image credit: future) As you are probably aware, processors are not created equal. For any given specific model of CPU, there will be slight variations in the production process which means that some chips are a little better than others (although they will all be in the same ballpark). So when you buy an unlocked processor - which can be overclocked - people refer to the 'silicon' lottery, essentially the meaning that you are keeping your fingers crossed that you get one of the best examples of that particular detailof cpu. since these slightly superior products could overclock considerably more headroom, but you do not have to rely on blind luck to ensure a good cpu in this sense, this because there are companies out there who buy in processors, try them to seehow good they are, and then sell them to pc builders who want a guarantee of what speed they will be able to overclock until. silicone lottery is a company that does exactly this, and we recently mentioned the company in a couple of pieces on new ryzen 3000 chips already running unusually near their maximum performance in terms of watches, generally speaking. Now, some warnings. Of course, these operations - which also include uk overclockers and the German caseking retailer - obviously charge more than rrp for these cpus, and some people believe that you are simply better to spend that extra money to upgrade other components to increase performance in your gaming platform. In fact, if this makes sense or not, and how much mileage you could get out of going this path, probably vary depending on the exact construction and processor you are looking at. In some cases, spending might be such that it could simply be a better idea to climb to a faster cpu (different) (assuming that there is one and you are not looking at the flagship already.) keep in mind that you may need to purchase a certain spec of motherboard (that is not an absolute entry-level model) to run a particular chip at the speed advertised by silicones (or anyone you purchase from) however, this is better option. Finally, remember that these cpus can be removed from the company to lower the temperature to which they work, which is still a useful boon for those who try to really push their processor to the limits. (image background: Corsair)2. do not jump on the psuon it is rare to see some quite handy game pcs builds proposed online, where the builder chose tomarket, perhaps even at the bottom of the line, non-critical components. This means the stuff that is normally considered not as important as the main components of the processor and GPU, GPU memory and primary storage. We are mainly talking about the PC case and power supply (PSU) here. These might look like good areas to save money so you can afford a better graphics card - but keep your corner cutting horses there a minute... We do not - repeat, not - be tempted to buy an economic power supply for your game PC. The CPU is generally considered as the engine of your PC, but if this is the brain of the machine, then the power supply is the pulsating heart that keeps everything working smoothly. Or not - if it is a second class model, it will not provide much stability for any overclock you are going to try. And if you get a cheaper model with a relatively low power rating, it can fight to manage the load from a high-end component group when they are really pushed. Also remember when you update your PC, perhaps to a much more beef GPU along the line, say, you might need some space to breathe with that wattage. In other words, a low-voltage PSU can interfere with the future protection of the PC. Additionally, there is also the prospect that a budget model could be so unreliable that it completely renounces the ghost, which means you have to buy another PSU (buy cheap, buy twice). And potentially worse, when that power supply pops, it could take some of your other components out of your pocket. All this said, you do not need to buy a hugely squeezed-up 1,500W PSU or similar. Such units can be prohibitively costly, and can not give you the best power efficiency when your machine is idling (which can be a good amount of time). In fact, these high power PSU types will almost certainly overkill for anything, but the game PC more over-the-top.how much power you will need depends on the type of machine you are building - if low-end, or a beast of a plant. You can use a power calculator and insert the components provided to get an indication of what type of PSU you could possiblybut be sure to leave a discreet amount of headroom for future protection (at least 25%). And get a PSU with at least one '80+ Bronze rating' for efficiency, from a quality brand (such as Corsair or Seasonic - we have some recommendations for the best PC power supplies here). This will probably last for a long time going on, which will save you long-term money (you can use the same PSU in your next game PC). In summary, you do not need to go stupidly outboard - but get a quality model, and do not jump. (Information source: CoolerMaster)3. Cooler Case Following from the above, while we will not put enough emphasis on buying a good case for your PC at the same time: buy an economic at your own risk. A basic PC case that cannot offer a large amount of space could leave the interior feeling very tight when all your components are inside (and paradise forbids something does not fit, of course). And such a case may not have many options for cable management. Well thought cable management design involves leaving a lot of holes so you can run hidden cables behind the motherboard tray, and a discreet amount of tie points to allow you to anchor the cables more tidily. Not having many cables - some of which can be quite thick - the round around your components helps with a better airflow during the case, and therefore a better cooling of your critical hardware like CPU and GPU. In short, not only clean wiring have the additional advantage of looking cool, but actually keeps your PC fresh (or cooler, anyway). Of course, a better case is also likely to have a superior design in terms of fan and vent positioning, and air flow in general, all to that same end. And as we have already touched, thelt can be a pretty vital problem if you are going to be overclocking hardware with your gaming PC. A couple of quick general tips here: if you go for a smaller case, it might be a good idea to buy a graphics card thatheat out from the back plate - away from the case - rather than inside the case. Because in a crowded environment, the latter is bad news. In addition, make sure the suction fans are protected by dust filters, because the powder is the other enemy of the PC components when it comes to overheating. Keeping in mind that, when you buy the game PC, also buy a can of compressed air, and every six months or so, use it to get rid of internal powder before this begins to accumulate in any amount. Obviously turn off your PC first, and be nice when you do this. When cleaning the powder from the blades of a fan, make sure to hold it steady (do not turn the fan around with the spraying of the air, as this can damage). It might be a good idea to set a repetitive 'clean my PC' reminder on a calendar somewhere so don't forget. Finally, remember that just like a PSU, a quality case can be brought to your next building(s), letting you set up with a great foundation forward. (Information source: PCPartPicker)4. Ask experts Once you have decided on your construction, post the full list of the components proposed on a forum techie populated by expert PC builders (or preferably some forums). This is a step that many people don't care - as it might take some time to subscribe to these message boards, assuming they are not already registered - but it is worth the effort to do so just before pressing the trigger to purchase all that hardware. You will usually get some interesting feedback, and maybe comments on different alternatives or configurations that can work better, or actually things that you can have clearly lost. You could be happy with this advice before you open your wallet, and it could be assaving money. Do not forget, PCPartPicker can be a useful resource when you put together and details/sharing your construction - and can in itself underline potential compatibility issues. (Information source: MSI)5. The Importance of Software In addition to all your juicy, juicy hardware,forget the software side of the equation when finally put together your game pc. when your plant starts to enter action, hwinfo (or CPU-Z alternative) is a great free utility to monitor how your components are performing and highlighting any issues before they get worse. prime95 is a useful tool for stress testing and to ensure the stability of the processor, and we talk about it in our article showing you how to overclock the cpu. msi afterburner is another smart software that is valuable when overclocking the graphics card, and fine adjustment of the speed of the gpu fan (note that this is not just for msi video cards.) and there are other top-notch free apps that are useful for any game pc we rounded here, including FLux that helps protect your view when indulge in long gaming sessions that stretch out in the night.
