## Convert 100 meter time to 100 yard time

October 14, 2010 If you're looking for a used convertible, the worst time to buy is spring and early summer. Most people interested in a drop top usually buy when the weather is warm. But if you can hold off until later in the year - November, or better yet, December - you'll save quite a bit. It's supply and demand: everyone wants a convertible as soon as the weather gets warm. But as the temperature cools off, so does demand for convertibles. Only downside - you won't find as good a selection when the mercury is low. Christmas is the optimum buying time, given that most folks hold off on car purchases in general due to holiday expenses and travel. TrueCar No-Haggle, CarsDirect, and NADAGuides are the quickest way to see the lowest car prices in your area. These sites show you no-haggle prices from dealers closest to you - and the deals are usually really good. This should be the first step you take when negotiating your car price. Follow this up with my checklist to make sure you squeeze out every last bit of savings. - Gregg Fidan Gregg Fidan is the founder of RealCarTips. After being ripped off on his first car purchase, he devoted several years to figuring out the best ways to avoid scams and negotiate the best car deals. He has written hundreds of articles on the subject of car buying and taught thousands of car shoppers how to get the best deals. Email Me and I'll be glad to answer them! Dennis van Zutjlekom/CC-BY-SA 2.0 To convert linear feet to square yards, it is necessary to find the square feet first by multiplying the length by the width and then dividing the square feet by 9. To illustrate, a carpet with a linear feet or length of 10 feet and a width of 12 feet is 120 square feet. To convert to square yards, divide 120 square feet by 9 to get 13.33 square yards. Linear feet usually refers to the number of feet in the length of any material, such as carpet, lumber, fabric and pipes, without regard to its width. It is assumed that such materials are manufactured in fixed widths, so when a person is quoting linear feet, it only refers to the length of the material. But when computing for the value in square yards, it is necessary to know the width to be able to compute for square feet (linear feet x width) before converting it to square yards. Knowing the conversion of linear feet to square yards is necessary because some materials are sold by the square yard. This is important not only for estimating how much material is needed, but also for knowing how much can be purchased within a particular budget. There are 118.11 inches, or approximately 9.84 feet, in 3 meters. Additionally, 3 meters are also equal to 3.28 yards. To convert from meters to inches, multiply a given length in meters by 39.37. The meter is a metric unit, and it is the base unit of length in the International System of Units. Some component units of the meter are the centimeter and millimeter, which are defined as 0.01 and 0.001 of a meter respectively. The U.S customary unit of an inch has been defined and internationally accepted to have an equivalence of 25.4 millimeters since 1959. The average human adult male is 1.75 meters tall. Four hundred meters is the equivalent of about 1,312 feet. One meter equals approximately 3.28 feet, so multiplying 400 meters by 3.28 feet per meter gives the equivalent of feet. Since 5,280 feet equal 1 mile, 400 meters is only slightly less than 1/4 mile. A 400-meter race is a common track and field event and is classified as a sprint. It is, however, a long sprint; at about 437.3 yards. It is the length of over four football fields from goal line to goal line. The Olympic Games feature not only 400-meter track and field events but also 400-meter swimming events. The method to convert kilometers to meters is demonstrated in this worked example problem. Express 42.88 kilometers in meters. 1 kilometer = 1000 meters Set up the conversion so the desired unit will be canceled out. In this case, we want meters to be the remaining unit.distance in m = (distance in km) x (1000 m/1 km)distance in m = (42.88 km) x (1000 m/1 km)distance in m = 42,880 m 42.88 kilometers is 42,880 meters This example problem demonstrates how to convert micrometers to meters. Human hair has a thickness that averages approximately 80 micrometers. What is this diameter in meters? 1 meter = 106 micrometersSet up the conversion so the desired unit will be cancelled out. In this case, we want m to be the remaining unit.distance in m = (distance in μm) x (1 m/106 μm)\*\*Note: 1/106 = 10-6\*\*distance in m = (80 x 10-6) mdistance in m = 8 x 10-5 m or 0.00008 m 80 micrometers is equal to 8 x 10-5 or 0.00008 meters. Convert Nanometers to Meters This example problem demonstrates how to convert 100 yards to meters. Both yards and meters are common units of length, so the conversion is simple: An American football field has 100 yards of playing field. How far is this in meters?SolutionStart out with a conversion factor: 1 yard = 0.9144 metersSet up the conversion so that the desired unit will be canceled out. In this case, we want m to be the remaining unit.distance in m = (distance in yard) x (0.9144 m/1 yd)distance in m = (100 x 0.9144) mdistance in m = 91.44 mAnswer100 yards is equal to 91.44 meters.Many conversion factors are difficult to remember. Feet to meters would fall into this category. An alternate method to perform this conversion is to use multiple easily remembered steps. 1 yard = 3 feet1 foot = 12 inches1 inch = 2.54 centimeters100 centimeters = 1 meter Using these steps we can express a distance in meters from yards as:distance in m = (distance in yd) x (3 ft/1 yd) (12 in/1 ft) x (2.54 cm/1 in) x (1 m/100 cm)distance in m = (distance in yd) x 0.9144 m/ydNote this gives the same conversion factor as above. The only thing to watch out for is for the intermediate units to cancel out.
