Majority of the iPhone & Mac consumers do not have a single idea on how to operate an Android or Windows PC. iMessage is not officially possible on Android, Linux, and Windows PC because the Apple company does not want consumers to experience premium apps on the non-Apple device. The logic applies to devices, software, and desktop environments. The Apple restrictions are part of the eco-system to keep the existing consumers trapped in iPhone's, iPad's and Mac PC's machines. 2 Ways to access iMessage Online on PC without Mac Using the Chrome Remote Desktop Extension Google Chrome web browser is available for Mac OS X operating systems. Open "Messages" from the launch pad. macOS prompts the administrator to sign-in to the Apple account. Now, login into the account, and you can pretty much use any available Apple account and that's what recipients are going to see. Click on "Messages" then click on "Preferences" from the drop-down menu.A new window shows up on your screen, where you have two options.General: You can customize your account based on your preferences.Accounts: Select the account. You can start interacting with the online iMessage users using the email address, so make sure to choose the right one. Apple allows the administrators to use multiple addresses so that you can maintain personal and business accounts at the same time. 7 Amazing iMessage Features: You Never Knew Innovation is Apple's vision for iPhone and texting was boring back in the days, and Steve Jobs wanted to create something unique. The consumers were tired of using a so-called smartphone that was not smart at all. Interestingly, texting is a popular trend for a long time now, and Apple wanted to create something unique out of the box. We are going to look at the unique features of iMessage, which were not possible back in the days. iMessage effects are possibly the most innovative in-built features a smartphone has today. I can bet that other manufacturers & software creators will follow effects idea soon.There is an option called "reactions" which are not available on Facebook as well. You can react to a message with an emoji, like or dislike.Bubble effects lovers are growing day-by-day, and it is an elegant way to open a message.The fun new animations are called "screen effects" causing a storm among the Apple consumers. The screen effects are incredible animations to mesmerize the recipient with texts. The message is hidden until the recipient taps on it, which creates a pool of curiosity.There is a popular saying "OLD IS GOLD" which doesn't seem to end the fun at all. The developers added "handwriting" in iOS 11 and iOS 12, and it enables the consumers to write a message using fingers.How about drawing a picture & send to a loved one? I am encouraging the idea, and it is a new feature called "Digital Touch" which allows the users to draw a picture within the iMessage.The additional package is not a new innovative idea, but it is a needed one. The art team updates the entire existing library of Emojis, Stickers, GIFS and more. You can use iMessage and start using mentioned features right from the beginning. I have not mentioned a lot of features, and it contains minor & major features as well. However, I have mentioned "UNIQUE," and I cannot go back from my word. Wrapping up I have come across the Jail Break Cydia app store, where you can find Remote Messages application and you can send and receive iMessages from the Windows PC online. Do not use such fishy apps from Cydia because it might contain Virus, Privacy invasion and Brick your device. iOS 11 and iOS 12 modern operating system might find it difficult to run Remote Messages application. People actively look for ways to use iMessage on Windows and Android. In a way, you can. But it is not convenient and also a waste of resources. The bottom line is that iMessage is exclusively available only on Apple devices like iPhone, iPad, iPort touch, Apple Watch, and Mac. Unlike Apple Music and Apple TV+, iMessage is not available officially on any other platform.But there are some workarounds like Beeper. Let me tell you more about them. And explain why you should not use remote much time or money in getting iMessage for Windows or Android.Getting iMessage on Windows PCUsing simulators and emulatorsSeveral top-ranking websites from Google Search recommend using emulators and simulators like iPadian.net, smartface.io, etc. To be straightforward, most of them are as good as useless for this job. Do not buy any of these services to get iMessage on Windows. They are a waste of time and money.iPadian has even gone a step ahead and mentioned it in bold letters on their homepage - 'iMessages is not supported by iPadian.' Still, some articles recommend this; some bash the simulator itself.Using Chrome Remote DesktopSecondly, let us talk about the Chrome Remote Desktop extension. Yes, using this, you can send, receive, and read iMessages from Windows Computer. However, I do not recommend this either as it requires a Mac that must always be powered on and connected to the internet. Even the screen needs to be continuously on!If you are firm and proceed with this method, the slightest miscommunication or drop of the network will disconnect the remote connection. Even the screen was letter-boxed to a smaller size when we tested it in our office. So, in short, it is doable, but not feasible. The same problems and limitations will be there even if you use any other remote desktop client.Verdict: There is no satisfactory way to use iMessage on Windows 10 computers or laptops.Getting iMessage on AndroidiMessage can't work smoothly on Android devices. In fact, the problems are almost similar to those faced with the Google Remote Desktop extension. However, if you are willing to keep a Mac always on and connected to the internet, the following services offer iMessage support on Android.weMessage: The steps to set up weMessage on Mac (as a server) and Android phone take time. As the app isn't available from Apple's official Mac App Store, you will have to modify your Security & Privacy settings to install this app on your Mac. Once it's installed, open it, and follow the instructions to set it up.AirMessage: The working principle behind AirMessage is the same as weMessage. You need a Mac running Yosemite or higher to act as a server. And you need the AirMessage app on the phone running Android Marshmallow or higher. Their official website has an instruction video explaining how to set everything up.What about the Beeper app everyone is talking about?We all use more than one messaging service. For example, I use WhatsApp for conversations, Slack for work, Twitter DMs for support, etc.Beeper; a ten-dollar monthly subscription service, combines all such popular services, including iMessage, and lets you have a single inbox. It is available on all major operating systems, including Windows, Android, and Linux.Source: Beeper.Thus, the bottom line is using Beeper; you can have iMessage on non-Apple platforms. Here is how they got it to work:Beeper has two ways of enabling Android, Windows and Linux users to use iMessage: we send each user a jailbroken iPhone with the Beeper app installed which bridges to iMessage, or if they have a Mac that is always connected to the internet, they can install the Beeper Mac app which acts as a bridge.To have a full step-by-step guide and a review, I signed up for Beeper on 2nd February 2021.After three days, I got an update. It said that within two weeks, I would be able to lock my username, and then we (who completed this process) would be invited in groups of 100 to use the app.Sadly, it has been around three weeks now. I haven't heard from Beeper again. Though, by following them and related people on Twitter, I got to know that they are working hard to secure used iPhones for iMessage to work on Windows and Android for users like me.Conclusion: If you really want to try this paid service, you may get started and join the queue via the official site.Your thoughts on iMessage for Windows and Android? hope this short article helped you make the correct choice. However, if you use your cell phone data, it will be deducted from your data plan. Sending photos or videos through iMessage can consume a large amount of data very quickly. To use iMessage as your standard SMS platform, you require a device with a SIM card. It is usually an iPhone, but you can also use an iPad with a dedicated cell phone number and SMS service. Everything else linked to your iMessage account (a MacBook, an iPod Touch, an Apple Watch, etc.) will work with this basic cell phone number. This is what makes Apple's iMessage platform so impressive - you can synchronously text from any iOS device, tableOS, along with macOS, and keep your iPhone in your pocket. However, there are a few settings that need to be enabled on each device for this to happen.
