Solodyn was the first to market with a prolonged liberation formulation and was approved by the FDA in 2006.<sup>37</sup> Ximino, approved in 2012, is the first extended release minocycline available in the form of a capsule, which some people prefer tablets.<sup>38</sup> Minolira is The first double-release minocycline tablet used to treat acne<sup>39</sup> and was approved by the FDA in 2017.<sup>39</sup> Each of the three brands once promotes a day, the weight-based dosage and can be taken with or without food. Sarecycline For example, moderate to severe acne is generally treated with an oral antibiotic, although several options are available, both through antibiotic classes. Esophageal corrosion tests with doxycycline monohydrate tablets. 2010; 5: 39. The change in inflammatory lesions will be the efficiency of the results of effectiveness for this review. This revision will begin by summarizing the studies of antibiotics of tetracycline class, followed by azithromycin and trimethoprim-sulfamethoxazole. Tetracyclines. Acnes resides and proliferates.<sup>11</sup> Two doxycycline formulations are available: Hyclare of doxycycline and doxycycline monohydrates, which are different forms of salt of the same active medication. However, there are a variety of available therapies, each aimed at one or more of these pathogenic processes.<sup>2</sup> The 4Pharmacologic treatments for acne<sup>40</sup> include a variety of topical and systemic agents. 2017; 1: 37-40. Data sheet of resistance to antibiotics. With the clinical studies and data currently available, there is a consensus that no antibiotic is superior to another with respect to efficiency.<sup>13,14</sup> However, the safety profiles differ considerably.<sup>15,16</sup> In this article, we will review previous investigations for several antibiotics. Trends in oral antibiotic prescription in dermatology, 2008 to 2016. After 16 weeks of treatment, reduction in lesion count and success rate were evaluated. Across the two studies, mean percent improvement in inflammatory lesions ranged from 43.1 to 45.8 percent for minocycline, compared to 30.8 to 31.7 percent for placebo.<sup>36</sup> In patients treated with minocycline, 15.9 to 17.3 percent achieved *ni detaulave neeb sah dna seiduts III esahP lanoitidart tnewrednu enilcycconim esaeler-dednetxe ,enilcycconim esaeler-etaidemmi dna enilcycyxod ekihnU53,41.* noitalumrof RE eht htih decuder era steve réves detropre ,ralimis si pilcycconim PI dna RE ref usciffo cht heughtA 53,42 elbiluva ullacid metox dna decceler ci enilcycconim hsiyu te star cht otluger enilcycconim RE enilcycconim RE( esahP etaidemmi htih noce reitarts asas hsaif dna eizayachtemahlyS mirmahteriT kralchbS elgacGJ

However, in the last years, there has been a growing concern about the development of antibiotic resistance. As such, some previously employed antibiotics (eg, erythromycin and clindamycin) are no longer used clinically due to their high resistance rates.<sup>11</sup> The concern is severe enough for the centers for control and prevention of diseases (CDC) and the World Health Organization (WHO) now actively promotes campaigns aimed at facing antibiotic resistance.<sup>10,12</sup> The CDC encourages antibiotic administration, which states that doctors should act in a manner Responsible when prescribing antibiotics, with the hope that this will limit the development and / or expansion of resistance to antibiotics. 10 The WHO "Global Action Plan" has

Although effective, its side effect profile, the need for frequent doses, and susceptibility to antibiotic resistance have made it unpopular, and it is no longer considered a standard treatment regimen.14 However, there are several tetracycline derivatives that have been chemically adapted to provide additional benefits.11 Therefore, this revised will not focus on tetracycline as a drug, but on the individual drugs that go into tetracycline, tetracycline class (i.e., doxycycline, minocycline and sarecycline).
