Why do humans explore

Why do humans explore mars. Why do humans like to explore. Why do humans have a desire to explore the world. Why do humans want to explore other planets. Why do humans explore space. What are the reasons that humans explore space. Why do humans explore outer space. Why do we explore.

À ¢ à ~ "The 360" shows several perspectives on the best stories and day debates. What is the perseverance of perseverance, the rover has landed in safety on the surface of Mars last week, giving scientists an unprecedented opportunity to study the distant planet. The main Missions of Rover is to seek signs of microbial life in the Martian ground and try new technologies that could benefit from a future space exploration. During the success of perseverance it is worthwhile celebrating alone, he also designed the renewed attention to a goal that fascinated space enthusiasts for more than half a century: a human mission in Mars. The task of transporting people to the red planet and keep them live on the surface presents a huge list of challenges, but rapid development technology has made the concept of sending a spacecraft horseback to Mars seem more feasible than ever. The Trump Administration has carried out NASA with the astronauts returning to the moon by 2024 with the aim of establishing systems that could support a trip to Mars by 2033. As ambitious as the NASA timeline is, it is substantially more slow of the one set by Elon Musk, which has claimed his spacex company could send human to Mars as soon as 2026. The billionaire established the ultimate goal of establishing a civilization À ¢ à,~ À "self-supporting civilization" On the marzian surface over the next few decades. What are the expert debates claim that the technology needed to support a human mission to Mars À ¢ à,~ "not to mention a colony on the planet - it is the pure imagination to this point. But there is also a related debate that someone should try to send humans to Mars, even if it is possible. Supports for sending humans to Mars claim that potential benefits exceed risks and costs. The planet, which is believed to have oceans and a billion atmosphere of years ago, could provide an extraordinary intuition of the life cycle of our planet, some claim. Mars can also provide revolutionary scientific opportunities or precious raw materials that could dramatically improve life on Earth. In the Grand Vision of Musk, which is shared by others, colonies on Mars can serve as a backup for humanity, in case the land becomes uninhabitable one day. The search for a human mission to Mars would also require a series of technological innovations that could benefit from humanity, a lot in the way the moon breed has brought a long list of innovations that help us today. Others say they go to Mars it is worth it simply because it would represent a spectacular human success even without any of the practical benefits. The agonents to send human to Mars say that robots are a bit cheaper, safer, simpler and many a more effective option to explore the planet. The presence of human beings on Mars could even undermine our scientific activities there, for example by contaminating the soil with microbes who traveled with them from Earth. Others argue that the technology necessary to establish civilization on Mars is so far away, canWell, be science fiction at this point. A much better goal, many argue, would be to pour out the resources necessary to reach Mars to help the Earth defend itself from climate catastrophe. What is below a series of future robotic missions on Mars in development that could be based on the discoveries made by Perseverance. Perhaps the most ambitious is a plan proposed for a rover capable of launching out of the planet and bringing samples of Martian soil on Earth to study them. ProspectsMarte Supporters Could Provide House For A Better Society? "Maybe Mars' charm will be an opportunity to build a new kind of society. "Can a settlement on Mars be a freer society than we enjoy on Earth, even considering the need for everyone to focus on pure survival? Maybe. "Mark Whittington, The HillMars is a way to satisfy the innate sense of humanity's adventure" Space scientists will have their own set of justifications for the astronomical costs of their projects, which usually focus on scientific discoveries, technological relapses, potential economic benefits and national security. But press a little stronger, and logical justifications tend to give way to variations on the 'why' there is. Publisher, New York TimesA mission on Mars would not prevent humans from saving the Earth"It seems perfectly plausible that the world can afford to fight climate change and explore the solar system. «Victor Tangermann, FuturismoThe search for Mars would lead to important technological discoveries». Exploring Mars involves overcoming countless challenges through engineering and innovation. "What we learn from successes and failures in addressing these challenges could trigger the next revolution that will make life in 2071 beyond anything we can imagine at the moment." The moon is a much better opportunity for the scientific exploration of the moon. The great advantage of the moon, of course, is that it's easier to reach and we've already done it in the past. But despite all the difficulties of landing on Mars and establishing a human presence, it is clearly the upper perspective for sustainable exploration. "It could be a house for people in a way that the Moon will never find." «David W. Brown, Wall Street Journal Following a mission on Mars will help the United States to re-establish itself as a world leader» «Making Great America» in reality and trying to regain the world reputation and the leadership role that once belonged to the United States. And moving away businesses like space exploration is not the right way to do it. «John Logsdon, a space historian, at AtlanticSkeptics! the costs of sending human beings to Mars exceed the possible benefits» «Bringing human beings to Mars, alsotheoretically possible, it would require an astronomically disproportionate investment with possible benefits. » as in Washington Post Robots are a better choiceBy exploring the planetÀ ¢ øtøday A geologist trained on the Moon can work as well as a robotic explorer, but the future of geological investigation on other worlds resides with much improved versions of our Mars Rovers. These explorers will embellish numerous tools to probe rocks and minerals, using a memory equal to - and soon superior à ¢ "to any human. They will pass through the lunar or Martian surface for decades, learning continuously on topography, on symographic activity and the distribution of geologic layers in bulk and in detail. »À ¢" Donald Goldsmith and Martin Rees, the American Scientific Human Mission could undermine our scientific Assumers on MarsÀ ¢ ø If humans eventually land on Mars, they would not have arrived alone. They would take their microbes with them. Trillions of them. There is a real risk that some of these microbes could find their way on the surface of Mars and, in doing so, confuse à ¢ "perhaps irreversibly so - the search for Martian life. à ¢ | Our presence on Mars could jeopardize one of our main reasons to be there - the search for life. "Zahaañ Btharnal, GuardianThe focus on Mars could prevent the exploration of other worlds" Intersima To promote a cycle of feedback in which more resources are dedicated to the exploration of the planet, which reveals new discoveries that add only interests, causing public and private sectors to devote more money to the exploration of Mars, and so on. Mars is important to study, sure to study, of course - but there are many convincing reasons to start exploring other relatively close worlds. À »Nesl V. Patel, MIT Technology Review Technology is so far from this It is not even worth discussing a Marsà ¢ øssed mission Humans have not even been able to return to the Moon since 1972, the chances of trying to go to a planet in another solar system is nothing but science fiction at this point. À ¢ "Antonia Jaramillo, Florida Today, Todayhuman's efforts should focus on saving Earth's life" Iperhaps instead of worrying about being swallowed by an expiry star in an incredibly distant future that we could devote an equivalent amount of intellectual and political energy to avoid climate catastrophe on this planet within the next decade or two. Just a suggestion. À »Byron Williston, Boston Reviewis there a topic you would like to see covered in à ¢ øLa 360? Send your suggestions to the360@yahoonews.com.lead more à ¢ ø360à ¢ shot Illustration: Yahoo News; Photo: scientists of Getty Images hypothesized in the 1970s that chimpanzees share almost 99% of our genetic makeup. It was a good hypothesis - research in the following decades has shown them right. After all humans, they have a lot in common with other animal species.pain, and if you've ever seen a cat attempt to jump on a hot stove and quickly withdraw, you'll also have decided that even cats do it. We have emotions, and as any dog owner can tell you, their dog friends exhibit joyful, affectionate and even depressed behaviors. depressed. If you look at a hemp -- a species believed by many to share a common ancestor with humans -- you'll see a lot of traits and behaviors that look much more human than animalistic. So what makes this little 1% difference between humans and chimp? Genetically, DNA comparisons reveal some alterations - a slightly mutated gene here, a different protein there. These deviations show us why human jaws are smaller than those of strains, and why we are more or less susceptible to certain diseases. Although genes are remarkably similar, their expression is not. Think this way: Sand and water can be combined to make either glass or just wet sand. But does evolutionary progress explain religion, art, literature, or moral decision-making? On a cognitive level, humans are very different from most species. We have self-awareness, spiritual curiosity and philosophical muses. We possess the ability of math, language, invention, mechanical adaptation and music. Chimp form a community, but there is a wide gulf between that community and human culture. And while chimps show self-awareness by recognizing themselves in mirrors, there is still no evidence that this self-awareness leads them to reflect on the greater mysteries of the universe (which, in their case, might be driven by the question, "What does chimps chimps do?"), human, and what makes human beings human. What exactly defines and constitutes the soul is a question philosophers have pondered since ancient times. At the time of Socrates' death in the 5th century, the soul of the term was used much the same way it is used today -- as not only what differentiates life from the dead, but as something responsible for our sense of justice, foresight, introspection, and our different emotional states. Interestingly, some branches of philosophical thought around the 5th and 6th centuries argued that animals and plants also had souls, and some philosophers - such as Empedocles, Anaxagoras and Democritus - did not differentiate between animals and plants, because both were alive [source: Lorenz]. Regardless, our thoughts seem much more complex than those of other species. You could argue that this is because we are Chimp 2.0 - a better version of a basic model. The other argument is that we have become something completely different, perhaps because of an evolutionary mix-up or even a higher power. power.
